Lesson 22 MAX7219 LED Dot Matrix Module

Introduction

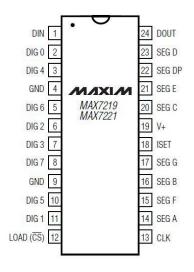

In this lesson, we will connect a MAX7219 and scroll the text across.

Hardware Required

- √ 1 * RuiiGuu UNO R3
- √ 1 * Max7219 module
- √ 5 * F-M wires (Female to Male DuPont wires)

Principle

MAX7219 LED Dot Matrix Module

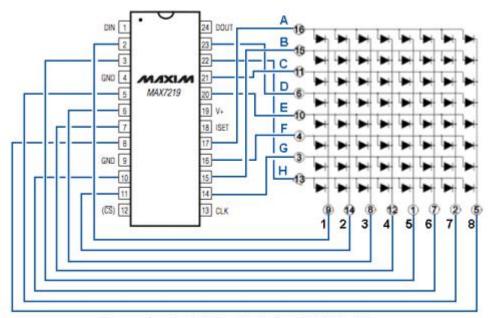

A typical 8x8 Dot Matrix unit has 64 LEDs arranged in a plane. You can get your hands on two types of Dot Matrices. One which comes as a plain single matrix which has 16 pins to control the rows and columns of the array. This one would use a lot of wires and things can get a lot messier.

To simplify these things, it is also available integrated with MAX7219 Driver, which has 24 pins. In the end,

you have 5 pins to connect to your I/O which makes your job a lot more easier.

There are 16 output lines from the 7219 driving 64 individual LEDs. Persistence of vision is exploited to make the LEDs appear to be on all the time when in fact they are not. You can also control the brightness of the LEDs through the code.

Connecting the 8x8 Display to the MAX7219 chip

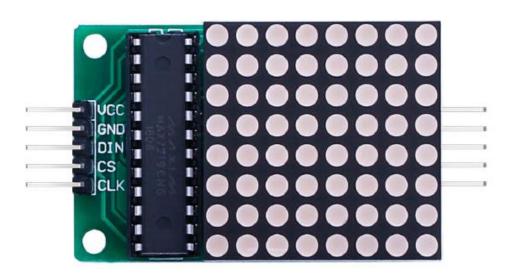

specification of this LED Matrix Module is shown below:

Operating Voltage: DC 4.7V - 5.3V

Typical Voltage: 5V

Operating Current: 320mA

Max Operating Current: 2A

Code interpretation

#include <LedControl.h>

```
#include "LedControl.h"
/*
Now we need a LedControl to work with.
These pin numbers will probably not work with your
hardware.
 pin 12 is connected to the DataIn
 pin 11 is connected to LOAD(CS)
 pin 10 is connected to the CLK
 We have only a single MAX72XX.
 */
LedControl Ic=LedControl(12,10,11,1);
/* we always wait a bit between updates of the display */
unsigned long delaytime1=2000;
unsigned long delaytime2=100;
void setup() {
  /*
  The MAX72XX is in power-saving mode on startup,
  we have to do a wakeup call
   */
 lc.shutdown(0,false);
 /* Set the brightness to a medium values */
 lc.setIntensity(0,8);
 /* and clear the display */
```

```
lc.clearDisplay(0);
}
/*
This method will display the characters for the word
"Arduino" one after the other on the matrix.
 (you need at least 5x7 leds to see the whole chars)
 */
void writeArduinoOnMatrix() {
  /* here is the data for the characters */
  byte a[5]={B01111110,B10001000,B10001000,B10001000,B01111110};
  byte r[5]={B00010000,B00100000,B00100000,B00010000,B00111110};
  byte d[5]={B11111110,B00010010,B00100010,B00100010,B00011100};
  byte u[5]={B00111110,B00000100,B00000010,B00000010,B00111100};
  byte n[5]={B00011110,B00100000,B00100000,B00010000,B00111110};
  byte o[5]={B00011100,B00100010,B00100010,B00100010,B00011100};
  /* now display them one by one with a small delay */
  lc.setRow(0,0,a[0]);
  Ic.setRow(0,1,a[1]);
 lc.setRow(0,2,a[2]);
  lc.setRow(0,3,a[3]);
  Ic.setRow(0,4,a[4]);
```

```
delay(delaytime1);
lc.setRow(0,0,r[0]);
lc.setRow(0,1,r[1]);
Ic.setRow(0,2,r[2]);
Ic.setRow(0,3,r[3]);
Ic.setRow(0,4,r[4]);
delay(delaytime1);
lc.setRow(0,0,d[0]);
lc.setRow(0,1,d[1]);
lc.setRow(0,2,d[2]);
lc.setRow(0,3,d[3]);
lc.setRow(0,4,d[4]);
delay(delaytime1);
lc.setRow(0,0,u[0]);
Ic.setRow(0,1,u[1]);
lc.setRow(0,2,u[2]);
lc.setRow(0,3,u[3]);
lc.setRow(0,4,u[4]);
delay(delaytime1);
lc.setRow(0,0,i[0]);
Ic.setRow(0,1,i[1]);
lc.setRow(0,2,i[2]);
```

```
lc.setRow(0,3,i[3]);
Ic.setRow(0,4,i[4]);\\
delay(delaytime1);
lc.setRow(0,0,n[0]);
Ic.setRow(0,1,n[1]);
lc.setRow(0,2,n[2]);
lc.setRow(0,3,n[3]);
lc.setRow(0,4,n[4]);
delay(delaytime1);
Ic.setRow(0,0,o[0]);
lc.setRow(0,1,o[1]);
lc.setRow(0,2,o[2]);
lc.setRow(0,3,o[3]);
lc.setRow(0,4,o[4]);
delay(delaytime1);
lc.setRow(0,0,0);
Ic.setRow(0,1,0);
Ic.setRow(0,2,0);
lc.setRow(0,3,0);
Ic.setRow(0,4,0);
delay(delaytime1);
```

}

lc.setRow(0,row,(byte)0);

}

}

}

```
/*
 This function lights up some LEDs in a column.
 The pattern will be repeated in every column.
 The pattern will blink along with the column-number.
 column number 4 (index==3) will blink 4 times etc.
 */
void columns() {
 for(int col=0;col<8;col++) {
   delay(delaytime2);
   lc.setColumn(0,col,B10100000);
   delay(delaytime2);
   lc.setColumn(0,col,(byte)0);
   for(int i=0;i<col;i++) {
     delay(delaytime2);
     lc.setColumn(0,col,B10100000);
     delay(delaytime2);
     lc.setColumn(0,col,(byte)0);
   }
```

}

}

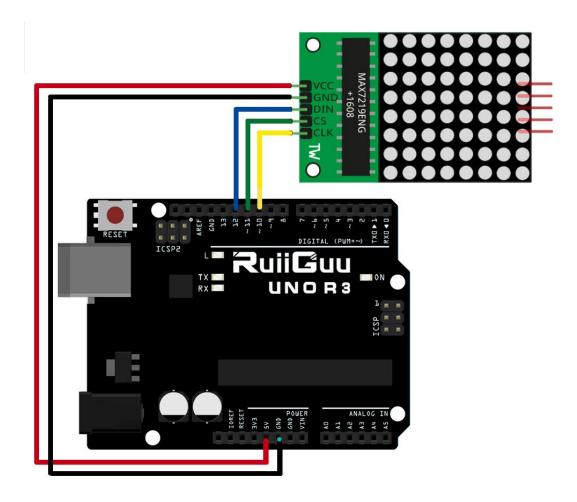

```
This function will light up every Led on the matrix.
 The led will blink along with the row-number.
 row number 4 (index==3) will blink 4 times etc.
 */
void single() {
  for(int row=0;row<8;row++) {</pre>
    for(int col=0;col<8;col++) {
      delay(delaytime2);
      lc.setLed(0,row,col,true);
      delay(delaytime2);
      for(int i=0;i<col;i++) {
        lc.setLed(0,row,col,false);
        delay(delaytime2);
        lc.setLed(0,row,col,true);
        delay(delaytime2);
      }
    }
 }
}
void loop() {
```

writeArduinoOnMatrix();

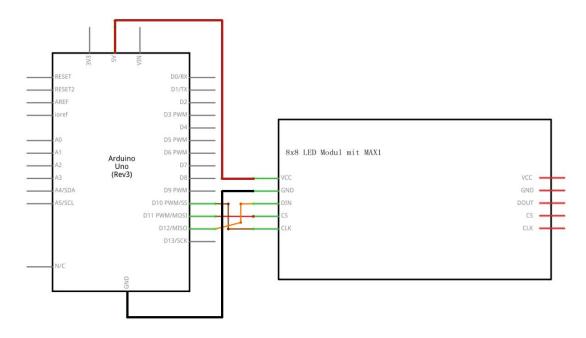

```
rows();
columns();
single();
}
```

Experimental Procedures

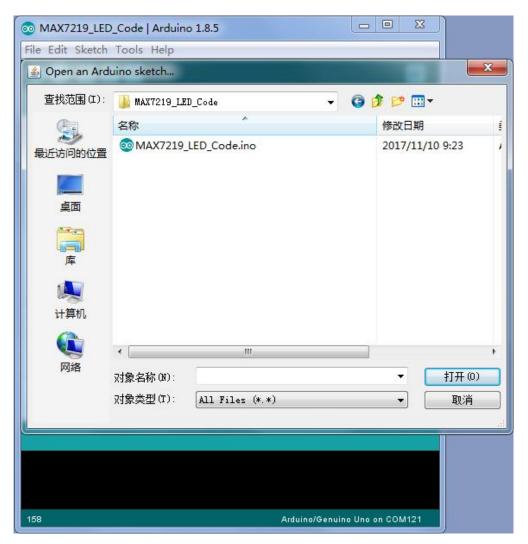

Step 1:Build the circuit

Schematic Diagram

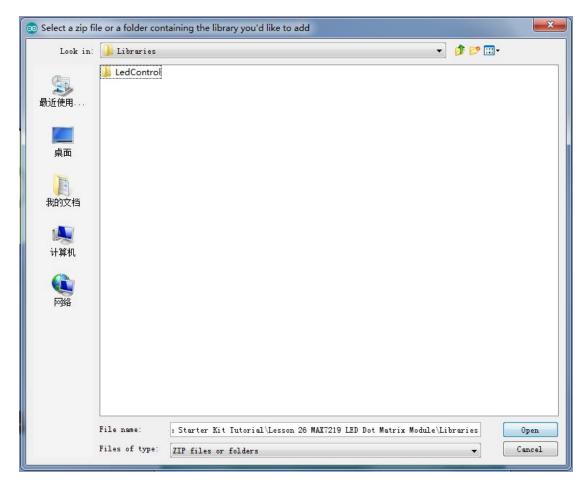

Step 2: Open the code:MAX7219_LED_Code

Step 3: Attach Arduino UNO R3 board to your computer via

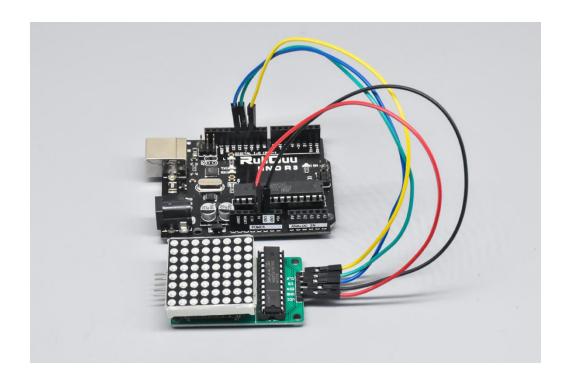

USB cable and check that the 'Board Type' and 'Serial Port' are set correctly.

Step 4: Load the Library:LedControl

Step 5:Upload the code to the RuiiGuu UNO R3 board.

Then, you can see that the MAX7219 LED starts flashing according to the programmed settings.

If it isn't working, make sure you have assembled the circuit correctly, verified and uploaded the code to your board. For how to upload the code and install the library, check Lesson 0 Preface.
